Competencies

Code

A5 CG5: The knowledge to perform measurements, calculations, assessments, appraisals, technical evaluations, studies, reports, task scheduling and similar work to each specific telecommunication area.

A37 CE28/TEL2 The ability to apply the techniques that are basis of computer networks, services and applications, such as management, signaling and switching, routing and securing systems (cryptographic protocols, tunneling, firewalls, charging mechanisms, authentication and content protection) traffic engineering (graph theory, queuing theory and teletraffic) rating, reliability and quality of service in both fixed, mobile, personal, local or long distance environments with different bandwidths, including telephony and data.

A40 CE31/TEL5 The ability to follow the technological progress of transmission, switching and processing to improve computer networks and services.

Expected results from this subject	Training and Learning Results	
Ability to apply mathematical methods of queueing theory to the analysis and design of	A5	
telecommunication networks and systems.	A37	
	A40	
Ability to understand the basic compromises in designing telecommunication networks and	A5	
systems in function of the parameters of traffic.	A37	
	A40	
Ability to use methods of discrete mathematics to resolve problems of routing and interconnection	1 A5	
of networks, reliability, quality of service and distribution of contents in wired and wireless	A37	
networks, fixed and mobile networks, access and transport networks.	A40	
Mastery of the necessary basic concepts to resolve problems of resource optimization in networks	. A37	
	A40	

Contents Topic

Queuing Theory	One-server systems. Finite queue systems. Systems with congestion: models of Erlang and Engset. Reversibility. Networks of queues with product solution. Applications: design of link capacity; design of buffer size; congestion in cellular networks; analysis of systems with priorities; provision of ARQ; provision of multiaccess networks.
Graph theory	Graph traversal and connectivity. Minimum cut, maximum flow. Tree coverage and expansion. Minimum cost trees. Graph coloring. Results and uses. Regular and irregular random graphs: small world networks, scale-free networks. Applications: Network topology design, the web graph, message broadcasting in wired networks and ad hoc networks.
Network Optimization	Utility Maximization. NUM decomposition problems. Applications.

Planning

Methodologies	
	Description
Master Session	It will present a systematic theoretical approach to the subject, highlighting the objectives, key concepts and relationships between different topics. Students should assimilate knowledge to enable them in the CG5, CE31/TEL5 and CE28/TEL2 competencies.
Practice in computer rooms	Guided practice where it is intended to study problems by both by applying analytical techniques and by using software tools, providing a training in the use of the latter. So students should acquire practical training in the CE28/TEL2 competency.
Projects	Group work focused on studying and solving a real problem using the techniques studied in theory and the software tool seen in practice. So students should gain practical experience that will enable them on the CE31/TEL5 competency.

Personalized attention			
Methodologies	Description		
Master Session	The student may consult individually in the tutoring hours all doubts that arise in the study of both the theoretical content and the use of the software tools of the practices.		
Practice in computer rooms	The student may consult individually in the tutoring hours all doubts that arise in the study of both the theoretical content and the use of the software tools of the practices.		
Projects	The student may consult individually in the tutoring hours all doubts that arise in the study of both the theoretical content and the use of the software tools of the practices.		

	Description	Qualification
Projects	Group work, presentation and defense of the resolution of a typical real-world problem by applying both theoretical knowledge as using, where appropriate, the software tools used in practical classes.	20
Long answer tests and development	Final test done on the total of the subject.	50
Long answer tests and development	Partial test developed over the first two themes, around the eighth week of class.	30

Other comments on the Evaluation

It is left to the discretion of the students two alternative evaluation methods in the subject: continuous assessment and onetime evaluation.

To pass the course both continuous assessment and one-time evaluation, the alumni must and pass the correctness test of the proposed practices for hours B of the subject. This ensures a minimum on the CE28/TEL2 competency.

Also the selection of continuous assessment involves conduct a non-scoring short test (15 minutes) of previous and basic knowledge on the second week at hour A. In addition to this short test, continuous assessment will consist on the group development of two projects (each project half the note), a partial test on the first two topics, and the completion of a written exam at the end of the quarter about the total content of the subject. The statements in the specification of the projects will be proposed before ending the respective classes about those topics. To be qualifying, the projects have to be delivered within a period not shorter than 7 calendar days after the relevant class C of discussion with the teacher about the progress of it, the teacher will qualify within 7 calendar days after delivery. The rating of the projects and partial test is effective only in the course they are proposed, including the second opportunity at the end of the academic year. In any case, the minimum score on the continuous assessment evaluation (once the requirements of the second paragraph and beginning of this one are met) is given by the result in the final test: score = max (0.2 x projects + 0.3 x partial + 0.5 x final, final). Passing partial and final test requires a minimum in the CG5 and CE31/TEL5 competencies while assessing the degree of training in the three of them including the CE28/TEL2 competency. The evaluation of projects is an additional measure of the degree of assimilation of the CE31/TEL5 competency.

The one-time assessment will consist of a written examination on the contents of the subject. The final grade (once the requirement of the second paragraph is met) will be the score obtained in the exam. Passing this test requires a minimum in the CG5 and CE31/TEL5 competencies while assessing the degree of training in the three of them including the CE28/TEL2 competency.

All students who have attended the partial test or attend the final exam will be subjected to a final qualification. The evaluation mode (continuous or one-time) will be chosen in the act of examination, exercise whose wording is different for each type of evaluation. Those who fail the course at the first opportunity at the quarter end have a second at the end of the academic year, similar to the first call: The evaluation mode (continuous or one-time) will be chosen in the act of examination, exercise whose statement will be different for each type of evaluation.
