Acoustic design of rooms.	Descriptors of room acoustics. Echoes in rooms. Focalization effects in rooms. Acoustic behaviour of audience: seat dip. Geometrical design of rooms. Design of conference rooms and classrooms. Recording studios: LEDE and Non-Environment design techniques.			
Acoustic insulation.	Introduction to the acoustic insulation. Acoustic isolation of single panels. Insulation of double walls. Introduction to the flanking transmission evaluation in buildings. Noise control in buildings.			

Planning				
	Class hours	Hours outside the classroom	Total hours	
Tutored works	7	28	35	
Practice in computer rooms	12	9	21	
Previous studies / activities	0	15	15	
Master Session	19	38	57	
Troubleshooting and / or exercises	2	10	12	
Short answer tests	2	8	10	

*The information in the planning table is for guidance only and does not take into account the heterogeneity of the students.

1ethodologies			
	Description		
Tutored works	The students will have to develop and write a report on three small projects:		
	 Design and building Helmholtz and membrane resonators. 		
	Design and acoustic measurements on scale models.		
	Software to calculate acoustic reflectors and diffusers		
	Through this methodology the general competencies CG2, CG5 and the specific competency CE36 and CE37 are developed.		
Practice in computer rooms	During practical sessions, the student will learn the use use of software to measure and analyse the impulse response of rooms.		
	Through this methodology the general competencies CG5 and the specific competency CE36 and CE37 are developed.		
Previous studies / activities	The students must study and prepare with the sources of information given before the lectures and the practical sessions.		
	Through this methodology the general competencies CG2, CG5 and the specific competency CE36 and CE37 are developed.		
Master Session	Lectures will be given, developing the main theoretical concepts of the subject. Through this methodology the general competencies CG2, CG5 and the specific competency CE36 and CE37 are developed.

Short answer tests	Short answers related to the theoretical content of the subject. Evaluation of the knowledge of regulations in the matter of room acoustics.		B2	

Other comments on the Evaluation

Following the guidelines of the degree, two systems of evaluation are offered: continuous assessment (recommended) and a final examination. Evaluation with only a final examination will be only allowed in situations in which it is imposible to follow the system recommended.

CONTINUOUS ASSESSMENT:

In order to be qualified following the continuous assessment proccess, the student will have to attend at least to the 80% of the programmed activities. The continuous assessment will be based in the evaluation of practical task, projects and two tests. Once a student has signed a document of agreement with the process of continuous assessment, the final degree will be obtained by the application of the criteria described bellow, even though a student could miss some of the tasks or tests envolved in the process.

The final grade with be obtained from the weighted sum of the grade obtained in the following tasks with the given weights:

- 1. Tutored works: The students will deliver three reports on tutored works during the weeks 5th, 9th and 14th. The total weight of tutored works on the final grade is 35 %.
- 2. Reports of practical tasks (Weight: 15 %).
- 3. Short answer tests : A short answer tests is scheduled around the 6th week. (25 % of the final grade)
- 4. A second examination, containing problems and exercises is scheduled on the official scheduled date at the end of the semester.(25 % of the final grade)

Tutored works are developed in groups. The final grade will be weighted taking into account the results of a cross assessment survey. To consider as "satiscactory" the contribution of each student to the group a minimum grade of 2 over 5 points is stablished.

The studenst have to show good skills in all the learning outcomes, therefore, four points over a ten points scale must be obtained in all the learning outcomes evaluated during the continuous evaluation process. The final grade will be obtaining through the addition of the grades obtained during the process with the weights given before. At least five over ten points should be obtained to pass the subject. The second test, will be performed before the final examination.

FINAL EXAMINATION

A final examination in the officeal date scheduled and officially published is available for all the students.

- 1. Students following the continuous evaluation process, will have the chance to improve their grade. Those students that did not reach the minumum grade required for the practical tasks, should deliver those jobes required for the teachers on the official scheduled date for the final examination.
- 2. The final examination is also available for those students that for some reason could not follow the continuous evaluation assessment process. In this case the final examination will consist in two short answer tests, and some additional questions related with the practical tasks and projects.

The subject is assessed in a 0 to 10 points scale and it is considered "passed" if the final grade obtained is equal or greater than 5.

SECOND CALL:

There is scheduled date in july for a final examination retake, for those students that either dropped out during the semester or failed. Prior the examination, a student can choose to follow the continuous assessment or the final examination. In the former selection, the grades obtained in the projects and practical tasks will be taken into account and the student will only answer to the short answer tests. If the later, (final examination), the student will have also to answer a full examination as described before. The conditions former described for the Continuous Evaluation asessment are kept in this second call.
