General description	This course belongs to the module of Basic Formation, and its main goal is providing to the students an overview of the world of the computers. The course is focused on making the students to learn how a computer works internally, from hardware and software perspective, as well as to design programs employing a high level language.
	It is proposed a course of computing and conceptual programming sufficiently general, oriented to provide to the student a perspective of designer and programmer of small applications. Although the course is not oriented to the study of a particular operating system or programming language, it does necessary employ a concrete language in the realization of the practical activities, becoming the learning of this language a secondary aim of the course.
Competenc	ies
Code	
provide	dge in basic and technological subjects that will enable students to learn new methods and theories, and them the versatility to adapt to new situations.
	to solve problems with initiative, decision making, creativity, critical thinking and the ability to communicate and it knowledge and skills in the field of Industrial Engineering in Mechanical specialty.
C3 Basic kr	nowledge on the use and programming of computers, operating systems, databases and software applications in
enginee	
	s and synthesis
	ns resolution.
	tion Management.
	tion of computer science in the field of study.
	to organize and plan.
D17 Working	g as a team.

		Phases in the development of a program.			
		Conclusions.			

Introduction to C programming language	Objectives and development: Once the student has mastered the basic concepts of programming, this unit introduces the C programming language. Most of this unit will be addressed in the practical sessions of the course.
	Topic index: Data types - Variables. - Expressions. - Operators. Structure of a C program. - Style in programming. - Basic instructions.
	<ul> <li>Sequential structure.</li> <li>The conditional structure.</li> <li>Simple conditional structure.</li> <li>Multi-conditional structure.</li> </ul>
	The repetitive structure. - Repetitive structures controlled by condition. - Repetitive structures controlled by counter. Strings and arrays. - Strings.
	<ul> <li>Vectors and matrices.</li> <li>Structured programming. Modules and subroutines.</li> <li>Definition of functions.</li> <li>Passing parameters by value and by reference.</li> </ul>
	Files. - Input and output with format. - Handling files. Conclusions.
Foundations of operating systems: concept, evolution and structure	Objectives and development: The objective of this unit is, on the one hand, to establish the concept of operating system, its functions and its aims, and on the other hand, to present its structure and main components to provide to the student with an overview.
	Topic index: Concept of operating system. History and evolution of the operating systems: types of systems. Components and services of the operating system. Structure of the operating system.
Basic computer architecture	Conclusions. Objectives and development: This unit is intented to present the structure and main components of a computer to provide to the student with an overview of its operation.
	Topic index: History and evolution of computers. Basic computer architecture. Main components. Conclusions.
Practice 0: Introduction to the computer lab and its tools.	Objectives and development: In the first session of laboratory the student will familiarise with the tools to be used during the course: Linux operating system, the command interpreter, gcc compiler and different text editors emacs, saw, nano, gedit, etc.
Practice 1: Variables. Data Input/Output.	Objectives and development: The fundamental goal of this session is that the student knows the different types of existent data, and that understands which functions allow to carry out the data input by keyboard and the data output by screen.
Practice 2: Flow diagrams.	Objectives and development: The goal of this session is that the student learns to develop flow diagrams in the design phase of a program.
Practice 3: Selective and repetitive structures.	Objectives and development: The main goal of these sessions is that the student understands the operation of the selective structures if-else and switch as well as the

repetitive structures for, while and do-while.

Practice 4: Manipulation of strings and arrays.	Objectives and development: The main goal of this session is that the student understands how the mechanisms of manipulation of strings and arrays work in the C language.
Practice 5: Manipulation of files.	Objectives and development: The fundamental goal of this session is the familiarization with data files. The student learns to design and implement solutions to a problem where it is necessary to access to text file to read and/or write data, being also an objective that the student understands how the system calls work.
Practice 6: Programming project.	Objectives and development: This practice consists in the resolution of a more complex problem, posed so that its solution needs the cooperative work of two students (or three students, as an exception).

Methodologies	
	Description
Lecturing	Participatory masterclasses.
	In these sessions, the faculty will explain in detail the basic theoretical contents of the course,
	exposing clarifying examples that help to better understand the concepts.
	Computer presentations and the blackboard will be used, especially to transmit information like
	definitions, charts, algorithms, etc. When it is possible, a copy of the presentations will be given to
	the students in advance, focusing the effort of the professor and the students on the exhibition and
	understanding of the concepts. Anyway, the reproductions in paper of the presentations should not
	be considered like substitutes of the texts, but like complementary material.
Practices through ICT	Small participatory master sessions.
	Sometimes, it will be necessary to explain in the laboratory practical concepts giving useful advices
	for the best advantage of the practical classes.
	Supervised laboratory practices.
	The didactic method to be followed in the teaching of the practical classes consists in that the
	professor supervises the work and progress done by the different groups. The practices of
	laboratory are headed to strengthen the theoretical concepts tackled in the sessions in the
	classroom (with the master sessions as well as with the design of the project).
Project based learning	Project-based learning.
, 5	As the course progresses, it will be proposed a project to be done in group (preferably of two
	people) that will last several weeks. We will use the educational methodology of project-based
	learning. The solution of the project will demand the contribution of the knowledge acquired by
	each member of the group, guaranteeing the positive interdependence that is required for the
	success of the collaborative work. On the other hand, the project will be evaluated guaranteeing
	the individual work and the positive interdependence, this is, all the members of the group must
	have worked and contributed to the final product and have to know all the aspects of the project.
	It will be provided material and bibliography, and it will exist the possibility of a public presentation
	of the project.
Seminars	An intensive course (10 hours long) is organized for those students who have failed the subject at
<u> </u>	first call, prior to the exam in second call. Group tutoring with the lecturer.
Problem solving	Resolutions of problems and/or exercises.
	These sessions, that take place in seminars and under the format of small group meetings, will serve for the resolution of questions about the project. Problems and exercises will be resolved by
	the students themselves.

# Personalized assistance Methodologies Description

Problem solving Regarding tutorials, it is possible to distinguish between academic and personalised tutorials. Students will be offered office hours so that they can ask every question related to contents, organisation and planning of the course. They can be one-to-one tutorials although group tutorials will be fostered in order to sort out the problems related to group activities or just in order to inform the instructor of the development of group work. Regarding one-to-one tutorials, each student will be able to talk to the instructor about any problem which is preventing her/him from coping with the subject properly, so that both can find a solution. By merging both kinds of tutorials, it is intended to compensate the different learning paces through measures of attention to diversity. The teachers will personally attend to the doubts and queries of the students, both in person, according to the timetable that will be published on the centre's website, and by telematic means (e-mail, videoconference, FAITIC forums, etc.) by appointment.

Assessment	Description	Qualification	an Lear	d ning
			Res	
Project based learning	The assessment of the programming project (practice 6) will be done by means of the following collection of strategies employed to value the process of project based learning: - Assessment of initial design of the project: 5% (Competencies CG3, CG4, CE3, CT1, CT6, CT7, CT17). - Delivered final product (code and report): 20% (Competencies CG3, CG4, CE3, CT1, CT2, CT5, CT6, CT7, CT17). - Improvements carried out over the initial specification of the project: 5% (Competencies CG3, CG4, CE3, CT1, CT2, CT5, CT6, CT7, CT17). - Project defense (personal interview): 10% (Competencies CG4, CE3, CT6, CT17). Since the project has to be evaluated so that it is guaranteed the individual work as		B3 C3 B4	D1 D2 D5 D6 D7 D1
	well as the positive interdependence (this is, all the members of the group must have worked and contributed to the final product and have to control all the aspects of the project), in the session of oral presentation, all the members of the group will intervene and, in the defence session, any member of the group must be able to answer to any question regarding the project, independently of the part in which they were specialised. All of them must show, therefore, deep knowledge of the delivered product, independently of the part on which they had focused their efforts.			60
Systematic observation	The participation and attitude of the student will be assessed during all the semester in theoretical classes and seminars as well as contributions in the online teaching platform.	r 5	B4	D2 D6 D7
Essay questions exam	Written exam: theoretical questions and problems The main goal of this exam is to assess the learning of all of the theoretical contents of the course. This exam must be complete, i.e., it will cover all of the contents, since the main goal is to assess what students know about the subject in general, not of a part of it. Second, the exam has to consist in a series of questions that make the conceptual and logical reasoning prevail, in order to verify the intellectual maturity of the students to obtain conclusions from the notions or the exposed theories in class.		B3 C3 B4	
Essay questions exam	The evaluation of the practices (with the exception of the practice 6 - project of programming) will be carried out through an examination of questions where it will be assessed the knowledge acquired by the student in the laboratory. This way, the instructor will ask about any aspect related to the practices implementation.	20	B3 C3 B4	D1 D2 D6

## Other comments on the Evaluation

The evaluation criteria of each section will be published at the beginning of the semester.

The final assessment of student will be the sum of the punctuation awarded to each one of the before commented parts, being their grade of continuous evaluation (CEG): CEG = 0.35 \* THEORY EXAM GRADE + 0.4 \* PROJECT GRADE + 0.2 \* PRACTICAL EXAM GRADE + 0.05 \* PARTICIPATION.

However, some minimum requirements in any of the sections will be demanded to guarantee the balance between all the types of competencies. Those requirements are: 1. To get at least a 5 over 10 in the project evaluation. 2. To get at least a 4 over 10 in the theory exam.

Those students that do not fulfil any of the previous requirements, will have to attend to the ordinary examination to be able to pass the course, and their grade of continuous evaluation will be calculated as follows:  $FINAL\_CEG = min(4,CEG)$ . All those students that wish to improve their qualification (obtained by continuous evaluation) will be able to attend to the ordinary exam. So much in the ordinary exam as in the extraordinary (July) all the competencies of the course will be evaluated. Thus, said examinations will include a practical programming test in the laboratory. Once finished the second semester, an intensive course (10 hours long) is organized to prepare the extraordinary exam.

ETHICAL COMMITMENT: it is expected that the students show an appropriate ethical behaviour. If any unethical behaviour (cheating, plagiarism, use of unauthorized electronic devices or others) is detected, the student will be punished with the impossibility to pass the course by continuous evaluation (where she/he would obtain a qualification of 0.0). If this type of behaviour occurs in ordinary or extraordinary exams, the student will obtain a qualification in the academic record of 0.0.

# Sources of information

#### Basic Bibliography

Osvaldo Cairó, Fundamentos de Programación: Piensa en C, 978-9702608103, Pearson Prentice Hall, 2006 Complementary Bibliography

A. Silberschatz, P. Galvin, y G. Gagne, **Operating Systems Concepts**, 978-0470128725, 8ª edición, John Wiley & amp; Sons, 2008

Gregorio Fernández Fernández, **Curso de Ordenadores. Conceptos básicos de arquitectura y sistemas operativos**, 84-7402-304-1, 5ª Edición, 2ª Edición en el Servicio de Publicaciones de la E.T.S.I. Telecomunicación. UPM, 2004

#### Recommendations

#### **Other comments**

This course has no prerequisites and no prior knowledge about the course is expected. The knowledge and skills that are acquired will allow the student to develop with guarantees skills of later courses in which the management of a computer and / or computer applications related to engineering is required.

- To be able to successfully complete the course, it is recommended that students have:
- a well-developed written and oral comprehension capacity,
- capacity for abstraction and synthesis of information,

- skills for group work and for group communication.

# Contingency plan

#### Description

In case the situation caused by COVID-19 results in the suspension of on-site activity, the following aspects must be considered.

#### ADAPTATION OF THE CONTENTS

The modification of the theoretical contents of the course is not considered necessary, given that the theoretical and seminar classes could be carried out by telematic means in a similar way to face to face.

The practices would be adapted in time and complexity to the situation of non physical attendance to be carried out by means of e-learning platforms, in a similar way to the face to face one.

The virtual machine, which is provided to the students, will allow them to work autonomously, especially in the programming project, and to carry out the practices remotely.

#### ADAPTATION OF TEACHING METHODOLOGIES

The following teaching methodology will be included:

Synchronous virtual masterclasses/practices: It is given through a web video-conference platform. Each virtual classroom contains various display panels and components, that can be customized to best suit the needs of the class. In the virtual classroom, the teacher (and those authorized participants) can share their computer screen or files, use a whiteboard, chat, stream audio and video, or participate in interactive online activities (surveys, questions, etc.).

Theoretical and seminar classes will be conducted via participatory video conferencing. For the practical sessions, the same platform will be used with the support of the virtual machine distributed to the students.

## ADAPTATION OF THE EVALUATION

The modification of the evaluation system is not considered necessary, but its format should be changed, since it would be carried out remotely by telematic means combining the FAITIC-Moodle e-learning platform and the Remote Campus of the

University of Vigo.
