General	At the end of this course students are expected to ha	eve the knowledge	s and skills for t	the selection, design and
description	calculation of air conditining, or HVAC&R, systems (h	eating, ventilating	, air conditionin	g and refrigeration).

Training and Learning Results

Code

- A4 Students can communicate their conclusions, and the knowledge and rationale underpinning these, to specialist and non-specialist audiences clearly and unambiguously.
- A5 Students must possess the learning skills that enable them to continue studying in a way that will be largely selfdirected or autonomous.
- C1 CET1. Project, calculate and design products, processes, facilities and plants.
- C9 CET9. Knowing how to communicate the conclusions -and the knowledge and rationale underpinning these, to specialist and non-specialist audiences clearly and unambiguously.
- C10 CET10. Possess learning skills that will allow further study of a self-directed or autonomous mode.
- C16 CTI5. Knowledge and skills for the design and analysis of thermal machines and engines, hydraulic machines and facilities for heat and industrial refrigeration
- D1 ABET-a. An ability to apply knowledge of mathematics, science, and engineering.
- D3 ABET-c. An ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability.
- D5 ABET-e. An ability to identify, formulate, and solve engineering problems.
- D11 ABET-k. An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

Energy, work and heat Mass and energy analyses of closed systems and control volumes Reversible thermal engines, refrigerators and heat pumps Heat transfer mechanisms
5. Thermal resistance concept 1. Moist air 2. Psychrometric properties
 3. Psychrometric Charts 1. Introduction 2. Adiabatic mixing of two streams 3. Condition line and sensible heat ratio 4. Sensible heating or cooling 5. Cooling and dehumidification 6. Heating and humidification
7. Adiabatic humidification 8. Heating and dehumidification 1. Introduction 2. Conduction 3. Convection 4. Radiation
5. Transient heat transfer6. Heat exchangers6.1. Classification6.2 Analysis
 Introduction Concept of thermal load Concepts of space, zone and building Components of thermal loads Types of systems Air systems Basics Description of the system and components Calculations Water systems Basics Description of the system and components Calculations Air-water systems Basics Description of the system and components Air-water systems Air-water systems Air-water systems Air-water systems Basics Direct expansion systems Basics

Planning			
	Class hours	Hours outside the classroom	Total hours
Lecturing	18	27	45
Laboratory practical	6	3	9
Autonomous problem solving	0	14	14
Essay questions exam	5	0	5

*The information in the planning table is for guidance only and does not take into account the heterogeneity of the students.

Methodologies	
	Description
Lecturing	Lecturer's introduction of the contents of the matter object of study
Laboratory practical	Real processes experimentations in the laboratory which complement the contents covered in the course. Use of software for modelling thermal systems.
Autonomous problem solving	Resolution of problems and/or exercises related with the course that the student will carry out following the classroom and/or laboratory guidelines. Examples of direct application of the contents studied as well as practical examples will be solved. The methodology will be focused on explaining how to solve the problems rather than on determining the final numerical solution.

Personalized assistance			
Methodologies	Description		
Laboratory practical	Students' questions or doubts about any of the course contents will be solved during the instructor's office hours.		
Lecturing	Students' questions or doubts about any of the course contents will be solved during the instructor's office hours.		

Assessment					
	Description	Qualificatio	n Trair	ing and Resu	_
Essay questions exam	Set of written exams to evaluate the contents of the course. The last of these tests will take place during the official date of the final exam. For those students that follow the continuous assessment mode, none of these exams will represent more than 40% of the final qualification of the course. For those students that do not follow the continuous assessment mode, the last exam will represent up to 100% of the final qualification of the course. For all thestudents, the final exam of the 2nd call will represent up to 100% of the final qualification of the course.		A4	C1 C9 C16	D1 D3 D5 D11
Objective question exam	ns Evaluation using digital tools that will be carried out, preferably, using telematic resources.	0-20	A4 A5	C1 C9 C10 C16	D1 D3 D5 D11

Other comments on the Evaluation

Assesment: The final qualification (CF) is determined by adding the points obtained on the written exam (PE) and those obtained using digital tools (HD). The grade using digital tolls (HD) will be scored over 2 points and thesum of the grades of the written exams (PE) will be scored over 10 points. The final qualification is obtained from the following formula:

CF=HD+(10-HD)*PE/10

Examples:

-HD=2 y PE=3. The final qualification is CF=2+8*3/10=4.4 (Suspenso)

-HD=2 y PE=3.75. The final qualification is CF=2+8*3.75/10=5.0 (Aprobado)

-HD=1 y PE=7. The final qualification is CF=1+9*7/10=7.3 (Notable)

-HD=0 y PE=9. The final qualification is CF=9 (Sobresaliente)

The points achieved using digital tools (HD) will be valid in the first and the second calls.

None of the qualifications obtained in the written exams (PE) performed during the course or on the date of the final exam of the first call will be saved for the second call. This means that the grade obtained in the final exam of the 2nd call will represent up to 100% of the final qualification of the course.

Ethical commitment: The student is expected to present an adequate ethical behavior. In the event that an unethical behavior is detected (copying, plagiarism, use of unauthorized electronic devices, for example), it will be considered that the

student does not meet the necessary requirements for passing the subject. Depending on the type of unethical behavior detected, it could be concluded that the student has not reached the competencies of the course.

IMPORTANT NOTE: this is the english translation of the subject guide. In the event of any conflict between the English and Spanish versions, the Spanish version shall prevail.

Recommendations

Other comments

In order to take this course it is highly recommended that students have completed courses about thermodynamics, heat transfer and thermal engineering and technology.

In particular, a good background in psychrometrics and psychrometrics processes is strongly recommended.
