General description	This course has a multidisciplinary nature in order to acquire the necessary skills to tackle integral projects in which they have to design and plan different types of facilities that are safe, efficient and compliant with standards and marked in legislation.			
	The aim is to provide students of structured content in the following sections:			
	Introduction. The diversity of facilities in the field of Industrial Engineering.			
	Complete design of installations in the field of Industrial Engineering.			
	Electrical installation and lighting.			
	Efficient Facilities: Energy saving and efficiency,			
	Design of air conditioning and ventilation			
	Design facilities fluids			
	Intelligent Buildings: Design of communications, automation and intelligent facilities.			
	Secure Infrastructure: Industrial Security. Security system design.			
	Regulations and Legislation.			
	To achieve this objective, the different areas of the EEI proposed multidisciplinary work related to the powers conferred on this matter.			
	Due to the multidisciplinary nature of this field, and the use and management of national and international regulations and legislation is necessary to have an adequate level of English. Therefore requirement is set to demonstrate a level of English B1 or equivalent. This subject is developed and fully evaluated in English.			

Competencies Code That the students can apply their knowledge and their ability to solve problems in new or unfamiliar environments A2 within broader (or multidisciplinary) contexts related to their field of study. That students are able to integrate knowledge and handle complexity and formulate judgments based on information A3 that was incomplete or limited, include reflecting on social and ethical responsibilities linked to the application of their knowledge and judgments. C1 CET1. Project, calculate and design products, processes, facilities and plants. CET5. Technically and economically manage projects, installations, plants, companies and technology centers. C5 C7 CET7. Apply their knowledge and solve problems in new or unfamiliar environments within broader contexts and multidisciplinary environments. CET8. Being able to integrate knowledge and handle complexity and formulate judgments based on information that C8 was incomplete or limited, include reflecting on social and ethical responsibilities linked to the application of their knowledge and judgments. C27 CGS8. Ability to manage research, development and technological innovation. C31 CIPC4. Knowledge and skills to plan and design intelligent electrical and fluid, lighting, air conditioning and ventilation, energy saving and, acoustic efficiency facilities, communications, automation and buildings and security installations. D1 ABET-a. An ability to apply knowledge of mathematics, science, and engineering. D3 ABET-c. An ability to design a system, component, or process to meet desired needs within realistic constraints such as economic, environmental, social, political, ethical, health and safety, manufacturability, and sustainability.

- ABET-d. An ability to function on multidisciplinary teams. D4
- ABET-g. An ability to communicate effectively. D7

D11 ABET-k. An ability to use the techniques, skills, and modern engineering tools necessary for engineering practice.

Contents		
Торіс		
Design and optimization of red mud	Similar work to the one herein proposed	
neutralization process through CO2 absorption.		
Automation of an industrial stacker crane and	Similar work to the one herein proposed	
warehouse prototype		
Lighting and energy efficiency in metal halide	Similar work to the one herein proposed	
lamps		
Implementation of a Product Lifecycle	Similar work to the one herein proposed	
Management (PLM) system for educational use		
Design and calculation of a pilot plant to obtain	Similar work to the one herein proposed	
biogas by slurry fermentation		
Implementation of a position control system	Similar work to the one herein proposed	
based on an air blower		
Electrical installation design of a business park	Similar work to the one herein proposed	

Planning			
	Class hours	Total hours	
Introductory activities	7	14	21
Project based learning	20	40	60

practice	the supervisor, who will assess individually the performance of each			C5	
	student.			C27	
				C31	
Oral exam	Questions asked by each student to students from other groups.	10	-		D7

Other comments on the Evaluation

- Information about the tests «Case studies» and «Oral exam»:

The work carried out by the students must be included in a report. All the students in each group will prepare and participate in an oral presentation of the work (in English) before a jury.

After the oral presentation of each group, the members of the jury will ask questions to the students of that group. Next, students in the audience (who are themselves enrolled in the subject) will have the opportunity to ask questions to the group.

At the end of the session, each student must have asked at least one question to students from other group. The pertinence of the questions and the answers will be assessed by the jury.

-In an eventual resit (June/July) the student will take an examination of the part not passed in the 1st exam call (January or May/June). It is compulsory to get a pass in the oral presentation to pass the subject.

- Ethical commitment: Students are expected to behave in a suitable ethical manner. If a non-ethical behaviour is detected (e.g., copy, plagiarism, use of unauthorized electronic devices, and others), it will be considered that the student does not fulfill the necessary requirements to pass the course. In that case, the global grade in the present academic year will be a "fail" (0.0).

-The use of any electronic devices during the evaluation session is forbidden unless explicit permission is given by the lecturer. The mere fact of introducing an unauthorised device in the classroom is reason enough to fail the subject. In that case, the global grade in the present academic year will be "fail" (0.0).
