Methodologies	
	Description
Lecturing	Lecturer's introduction of the contents of the matter object of study
Laboratory practical	Real processes experimentations in the laboratory which complement the contents covered in the course. Use of software for modelling thermal systems.
Autonomous problem solving	Resolution of problems and/or exercises related with the course that the student will carry out following the classroom and/or laboratory guidelines. Examples of direct application of the contents studied as well as practical examples will be solved. The methodology will be focused on explaining how to solve the problems rather than on determining the final numerical solution.

Personalized assistance			
Methodologies	Description		
Laboratory practical	Students' questions or doubts about any of the course contents will be solved during the instructor's office hours.		
Lecturing	Students' questions or doubts about any of the course contents will be solved during the instructor's office hours.		

Assessment					
	Description		on Trair	ning and Learning Results	
Essay questions exam	 Set of written exams to evaluate the contents of the course. The last of these tests will take place during the official date of the final exam. For those students that follow the continuous assessment mode, none of these exams will represent more than 40% of the final qualification of the course. For those students that do not follow the continuous assessment mode, the last exam will represent up to 100% of the final qualification of the course. For all thestudents, the final exam of the 2nd call will represent up to 100% of the final qualification of the course. 		Α4	C1 C9 C16	D1 D3 D5 D11
Objective question exam	ns Evaluation using digital tools that will be carried out, preferably, using telematic resources.	0-20	A4 A5	C1 C9 C10 C16	D1 D3 D5 D11

Other comments on the Evaluation

Assessment: The final qualification (CF) is determined by adding the points obtained on the written exam (PE) and those obtained using digital tools (HD). The grade using digital tolls (HD) will be scored over 2 points and thesum of the grades of the written exams (PE) will be scored over 10 points. The final qualification is obtained from the following formula:

CF=HD+(10-HD)*PE/10

Examples:

-HD=2 y PE=3. The final qualification is CF=2+8*3/10=4.4 (Suspenso)

-HD=2 y PE=3.75. The final qualification is CF=2+8*3.75/10=5.0 (Aprobado)

-HD=1 y PE=7. The final qualification is CF=1+9*7/10=7.3 (Notable)

-HD=0 y PE=9. The final qualification is CF=9 (Sobresaliente)

The points achieved using digital tools (HD) will be valid in the first and the second calls.

None of the qualifications obtained in the written exams (PE) performed during the course or on the date of the final exam of the first call will be saved for the second call. This means that the grade obtained in the final exam of the 2nd call will represent up to 100% of the final qualification of the course.

Ethical commitment: The student is expected to present an adequate ethical behavior. In the event that an unethical behavior is detected (copying, plagiarism, use of unauthorized electronic devices, for example), it will be considered that the

student does not meet the necessary requirements for passing the subject. Depending on the type of unethical behavior detected, it could be concluded that the student has not reached the competencies of the course.

IMPORTANT NOTE: this is the english translation of the subject guide. In the event of any conflict between the English and Spanish versions, the Spanish version shall prevail.

Recommendations

Other comments

In order to take this course it is highly recommended that students have completed courses about thermodynamics, heat transfer and thermal engineering and technology.

In particular, a good background in psychrometrics and psychrometrics processes is strongly recommended.
